

AOF Series – Industrial Air Cooled Copper Tube/Aluminum Fins

The Industrial AOF Series has the same features as the AO Series, just with an addition, a replaceable air filter to protect the heat exchanger in adverse environments.

The AC fan drive and is ideal for medium flow rates and moderate heat removal. This series is available with an optional internal pressure bypass. Cabinet louvers allow the user to regulate the direction of heated ex-haust air. This versatile design allows for a one or two pass configuration.

TTP's XSelector® sizing program can be used to help optimize the sizing of the cooler for better performance and value.

How to Order

Model Series

AOF
AOFR - with Bypass

Model Size Selected

5, 10, 15, 20, 25, 30, 35, 40
(See Performance Curve Charts on page 2 for sizes or XSelector® sizing program)

Number of Passes*

Blank - No Bypass
1 - One Pass
2 - Two Pass
***ADD FOR AORF MODELS ONLY:** Number of passes

Connection Type

Blank - NPT
S - SAE
M - Metric

Bypass Setting*

Blank - No Bypass
30 - 30 PSI
60 - 60 PSI
*** ADD FOR AORF MODELS ONLY:** Bypass setting
This is a partial flow pressure bypass only.
It is not designed to be a full flow system bypass.

Foot Mounted Brackets

Blank - No Bracket
FB - Foot Bracket

Specify Motor Required

1PH - Single Phase
1PH EXP - Single Phase Expl. Proof
3PH - Three Phase
575V - Three Phase 575 Volt
3PH EXP - Three Phase Expl. Proof
NM - No Motor

Options

Internal pressure bypass

Foot brackets

SAE & metric connections

Corrosive resistant marine coating

Ratings

Maximum Operating Pressure 300 PSI

Test Pressure 300 PSI

Maximum Operating Temperature 400°F

Materials

Tubes Copper

Fins Aluminum

Turbulators Steel

Fan Blade Aluminum with steel hub

Fan Guard Zinc plated steel

Cabinet Steel with powder coat finish

Manifolds Steel

Connections Steel

Piping Diagram

AOF - One Pass

AOF - Two Pass

AORF - One Pass with Bypass

AORF - Two Pass with Bypass

Download the XSelector® for both Apple and Android formats by searching for XSelector® in their App Stores. You must first register for XSelector® before using it on mobile devices.

For additional sizing information consider using TTP's **XSelector®** online sizing Program.*

Performance Curves

One Pass Oil

Two Pass Oil

Oil Pressure Correction

Selection Procedure

Performance Curves are based on 50SSU oil leaving the cooler 40°F higher than the ambient air temperature used for cooling. This is also referred to as a 40°F approach temperature.

STEP 1 Determine the Heat Load. This will vary with different systems, but typically coolers are sized to remove 25 to 50% of the input nameplate horsepower.

(Example: 100 HP Power Unit x .33 = 33 HP Heat load.)

$$\text{If BTU/HR is known: } \text{HP} = \frac{\text{BTU/HR}}{2545}$$

STEP 2 Determine Approach Temperature. Desired oil leaving cooler °F – Ambient air temp. °F = Actual Approach

STEP 3 Determine Curve Horsepower Heat Load. Enter the information from above:

$$\text{Horsepower heat load} \times \frac{40 \times \text{Cv}}{\text{Actual Approach}} = \text{Curve Horsepower}$$

STEP 4 Enter curves at oil flow through cooler and curve horsepower. Any curve above the intersecting point will work.

STEP 5 Determine Oil Pressure Drop from Curves:

● = 5 PSI ■ = 10 PSI ▲ = 15 PSI + = 20 PSI

Multiply pressure drop from curve by correction factor found in oil Δ P correction curve.

Desired Reservoir Temperature

Return Line Cooling: Desired temperature is the oil temperature leaving the cooler. This will be the same temperature that will be found in the reservoir.

Off-Line Recirculation Cooling Loop: Desired temperature is the oil temperature entering the cooler. In this case, the oil temperature change must be determined so that the actual oil leaving temperature can be found.

Calculate the oil temperature change (oil Δ T) with this formula:

$$\text{Oil } \Delta T = (\text{BTU's/HR}) / (\text{GPM Oil Flow} \times 210).$$

To calculate the oil leaving temperature from the cooler, use this formula:

$$\text{Oil Leaving Temp.} = \text{Oil Entering Temp.} - \text{Oil } \Delta T.$$

This formula may also be used in any application where the only temperature available is the entering oil temperature.

Oil Pressure Drop: Most systems can tolerate a pressure drop through the heat exchanger of 20 to 30 PSI. Excessive pressure drop should be avoided. Care should be taken to limit pressure drop to 5 PSI or less for case drain applications where high back pressure may damage the pump shaft seals.

Oil Temperature

Typical operating temperature ranges are:

Hydraulic Motor Oil	110° - 130°F
Hydrostatic Drive Oil	130° - 180°F
Bearing Lube Oil	120° - 160°F
Lube Oil Circuits	110° - 130°F

*To register for **XSelector®** please go to www.thermaltransfer.com/get-in-touch/ and complete the **XSelector®** Inquiry form and submit.
